

JP-A-H7-182112 discloses:

Purpose: To provide a data processor which contains a secret protecting function of writing data to a replaceable storage medium to enable even another processor to read the file data out of the storage medium.

Constitution: A data processor is provided with a coding means which codes the file management data recorded on a replaceable storage medium, and a decoding means which decodes the coded data. Then a reading/writing means is added to write or read the uncoded data into or out of the medium. Thus the data decoded by the means are recorded on the medium by the means. When a user approves to read the file data by another data processor, the data coded in the medium are decoded. Then the coded data that can be read by another data processor are recorded on the medium by the means.

The data are encoded using a value randomly written, with respect to a byte, based on a encoding table.
